Streamline your end-to-end B2B payment processing with **Enterprise Payment Exchange**

Payment processing integration allows for payment transaction data derived from credit/debit card or other electronic payments (such as those made over the Internet or on mobile devices) to automatically flow into a business' accounting or ERP system when a sale is made. It does away with the need to manually enter payment transaction data and reconcile accounts, saving valuable time and reducing labor costs and eliminating the possibility of human error.

Enterprise Payment Exchange (EPX) is a SAP Certified solution which connects an enterprise payment gateway, powered by BlueSnap, to your SAP systems to create a communication channel between your systems and payment processes so you can automate reconciliation. Our low-cost, frictionless B2B payment solution automates manual processes, optimised transaction costs, and speeds up time-to-cash.

The EPX solution suite enables integration of payment card processing in SAP to the BlueSnap payment processing gateway

EPX Order Processing

This is the core module of the EPX application which enables processing for all card types accepted by the BlueSnap platform for authorisation and settlement / capture, including both charges to customer cards and credits/refunds.

EPX AR

The AR module allows you to clear your open items with the merchant using both corporate procurement cards and standard credit cards; as well as making payments direct to customer accounts without clearing or cancel the existing payments.

EPX E-Commerce

Operating in conjunction with order processing and AR, the e-commerce module enables payment card processing functionality from a web-store for full integration of tokenisation and card authorisation with the back-end SAP environment.

Available on **SAP Store**

Five reasons to use **Enterprise Payment Exchange**

End-to-end Payment Processing

Streamline and automate across multiple channels providing better communications, efficiency, financial forecasting and scalability

Global Processing Capability

Enables processing for over 100 card types, covering 200 countries and currencies globally. With our dynamic routing we can ensure optimised costs and approval rates

Increased Cash Flow

Releasing valuable capital back into financial supply chain by drastically reducing DSO from 30–90 days to 24-72 hours

PCI Compliant Data Security

All card information is tokenized with our Card Registration Technology, so it safely vaults sensitive information in a PCI-compliant way

Boost Your ROI

Drive more efficiency and save over 50% on your AR costs by automating reconciliation

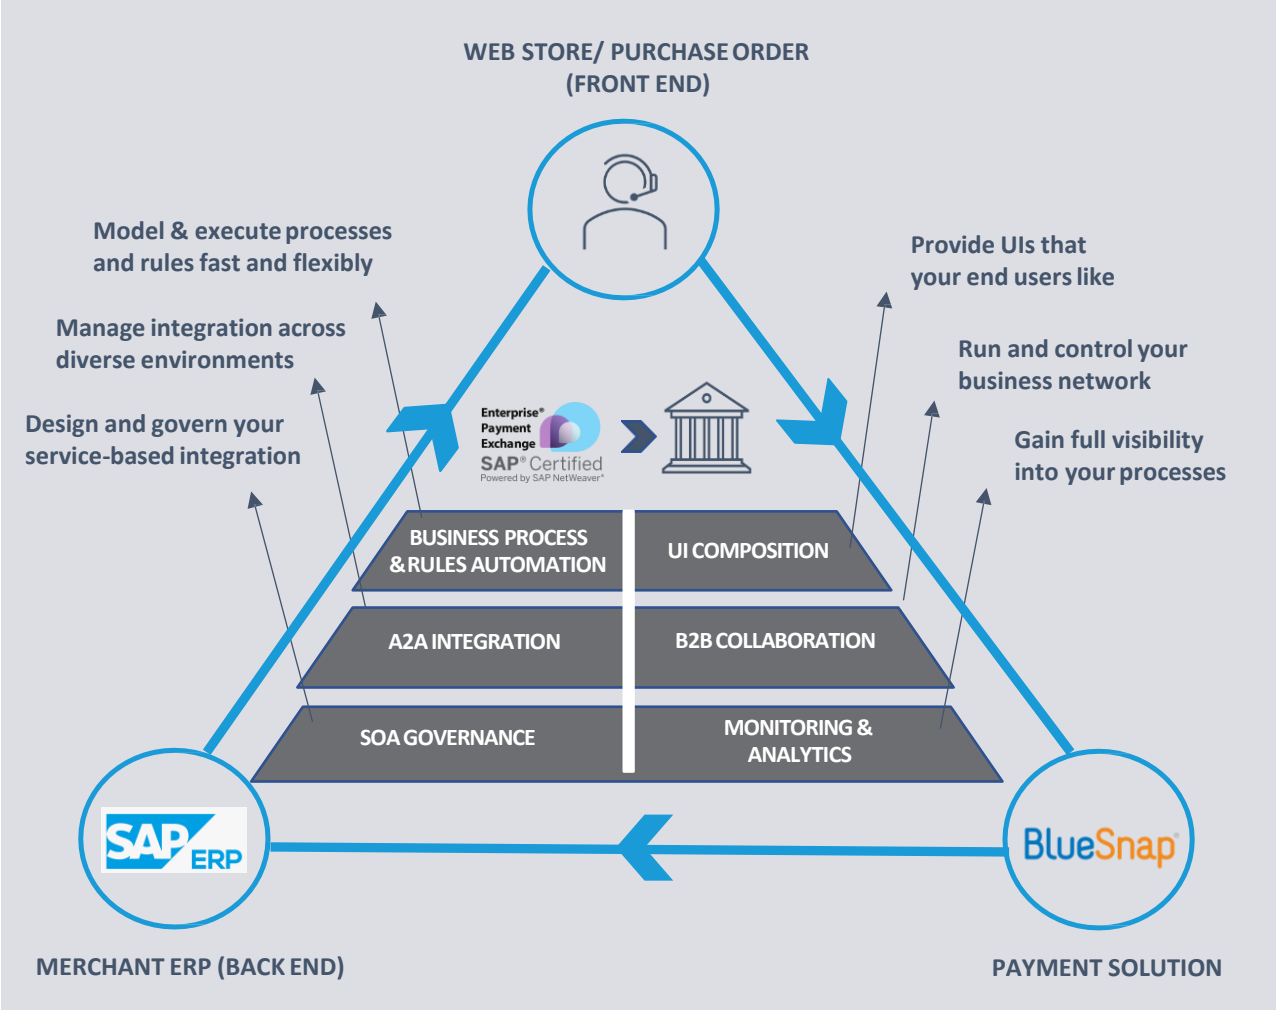

Fully automate your credit card processing and SAP ERP AP and AR processes with **Enterprise Payment Exchange**

Typically B2B payment solutions provide payment processing, however their value proposition is often a linear solution which focuses on the backend processes leaving a huge disconnect to their frontend processes. This means they are unable to provide functionality to fully automate your AP and AR processes.

EPX bridges that gap to deliver seamless communication between the SAP backend, Web Store and Payment Gateway to create a fully automated payment and auto reconciliation loop. It is based fully within your SAP system and uses available SAP web-service interfacing technology to communicate securely to the BlueSnap payment gateway. It is also possible to add SAP PI integration layer to the communications from SAP ECC system to BlueSnap.

Our pre-built SAP integrators are plug and play, enabling you to have a card processing solution up and running instantly.
