Automate your product buying process with **Intelligent Content Capture**

For many buying organizations, catalog management has fast become a popular feature to support the procurement process. The ability to self-select goods electronically, and in a compliant manner, removes a series of headaches for the procurement department. But how can you achieve a similar level of control and automation with your non-catalog requests?

Intelligent Content Capture (ICC) is a simple and time-saving application, enabling internal buyers to self-service their own purchases through procurement approved suppliers and marketplaces.

ICC offers a consolidated view across all existing catalogs and non-catalog items. In addition, integrating this solution with e-procurement, accounting, and other management systems, also speeds up wider business processes – including invoicing, reporting, auditing and compliance.

Five reasons to use **Intelligent Content Capture**

Increase approved suppliers volumes

Extend guided buying access to more approved suppliers to increase purchases through an approved source.

Cost reduction through price comparisons

Consolidated search results allows the lowest cost supplier to be chosen every time.

Reduce standard non-catalog requests

Automated product data capture from approved sites increases the quality of requests, speeding up the process and reducing manual intervention.

Consolidate all existing catalogs

The app provides a single view of products from multiple catalogs without the user needing to view each catalog separately.

Seamless integration with your purchase requisition system

Integrates with any cXML PunchOut site and requires no change to your downstream procurement processes.

Combine your catalog and non-catalog requests into a single compliant e-procurement process with **Intelligent Content Capture**

Intelligent Content Capture is fully integrated with Guided Buying functionality in SAP Ariba Buying and Invoicing, allowing your internal buyers to simultaneously search both internal and external catalogs, reducing the number of standard non-catalog requests, increasing compliance and control and driving down procurement costs.

How it works

Users access Non-Catalog Wizard app through Guided Buying functionality in SAP Ariba Buying & Invoicing

A product search is executed against selected approved sites, both catalog and non-catalog.

Search results are listed and the user selects items for checkout

cXML Punchout technology imports item details into SAP Ariba

Catalog items are purchased and non-catalog Items progress through standard purchase requestion and approval process

Purchase Order is issued to supplier
